

FOIL

UNIQUE ECMO
SECURING PLATE VALIDATED
FOR EASY AND SAFE
TRANSPORT ONTO
A STRETCHER

Placing an ECLS device between the patient's legs is a common approach during intra and out-of-hospital ECLS transports. To date, though, there were no validated solutions available and each centre had to develop its own way.

FOIL is the only device in the market that is certified and validated to carry ECLS devices on a stretcher between the patient's legs.

With high-quality carbon-fiber design and ergonomic tailored wings that minimize weight while increasing comfort for patients and operators, Foil can be attached to any stretcher and ensures convenient positioning of the ECMOLife during any type of transport.
